

Eliminator® West Texas Results

Prior to Eliminator Treatment

1 Week of Eliminator Treatment

As you can see, prior to **Eliminator®** treatment, the oil had some yellowish liquid below the oil consisting of some black matter. The yellowish part is because of the paraffin content and the black matter is called a pad and is normally very tough to drop out or demulsify. **Eliminator®** cleaned up the oil and the water. **Eliminator®** broke the long chains of the paraffin and the asphaltenes (black matter) and made it become part of the sellable oil while cleaning and separating the water in the oil. The oil enhancing and the emulsion breaking capabilities are second to none.
